Thank you for choosing the LUCAS® 3 Chest Compression System.

With the help of the LUCAS® 3 device, your cardiac arrest patients will receive effective, consistent and continuous chest compressions as recommended in the American Heart Association (AHA) and European Resuscitation Council (ERC) guidelines for cardiopulmonary resuscitation.

If you have any questions about this product or its operation, please contact your local Physio-Control or Stryker representative or the manufacturer Jolife.

1 Important user information

The information in these Instructions for Use applies to the LUCAS® 3 Chest Compression System, version 3.1, also referred to as the LUCAS device.

All operators must read the complete Instructions for Use before operating the LUCAS Chest Compression System.

The Instructions for Use must always be easily accessible to the operators of the LUCAS device.

Always follow local and/or international guidelines for cardiopulmonary resuscitation (CPR) when you use the LUCAS Chest Compression System.

The use of other medical equipment or drugs in conjunction with the LUCAS device can affect the treatment. Always consult the Instructions for Use for the other equipment and/or drugs to make sure that they are appropriate for use in conjunction with CPR.

The LUCAS factory default settings are consistent with 2015 American Heart Association (AHA) and European Resuscitation Council (ERC) guidelines. Setup options should be changed only under the direction of a physician knowledgeable in cardiopulmonary resuscitation who is familiar with the literature in this area.

The LUCAS Chest Compression System can only be bought by or on the order of a licensed medical practitioner.

TRADEMARKS
LUCAS® is a registered trademark of Jolife AB.

DECLARATION OF CONFORMITY

The EU Declaration of Conformity is available at www.lucas-cpr.com.

The device is marked with the CE-symbol:

© 2018 Jolife AB. All rights reserved.
2 Introduction

2.1 LUCAS Chest Compression System

The LUCAS Chest Compression System is a portable tool designed to overcome problems identified with manual chest compressions. The LUCAS device assists rescuers by delivering effective, consistent and continuous chest compressions as recommended in the American Heart Association guidelines\(^1\) and the European Resuscitation Council guidelines\(^2\).

The LUCAS Chest Compression System can be used in a wide variety of situations and settings; on the scene, during patient movement, during transportation in road and air ambulances, in hospitals and catheterization laboratories.

2.2 Intended use

LUCAS Chest Compression System is to be used for performing external cardiac compressions on adult patients who have acute circulatory arrest defined as absence of spontaneous breathing and pulse, and loss of consciousness.

LUCAS must only be used in cases where chest compressions are likely to help the patient.

The LUCAS device is intended for use as an adjunct to manual CPR when effective manual CPR is not possible (e.g., during patient transport or extended CPR when fatigue may prohibit the delivery of effective/consistent compressions to the victim, or when insufficient EMS personnel are available to provide effective CPR).

2.3 Contraindications

Do NOT use the LUCAS Chest Compression System in these cases:

- If it is not possible to position the LUCAS device safely or correctly on the patient’s chest.
- Too small patient: if the LUCAS device alerts with 3 fast signals when lowering the Suction Cup, and you cannot enter the PAUSE mode or ACTIVE mode.
- Too large patient: If you cannot lock the Upper Part of the LUCAS device to the Back Plate without compressing the patient’s chest.

Always follow local and/or international guidelines for CPR when you use the LUCAS Chest Compression System.

2.4 Side effects

The International Liaison Committee on Resuscitation (ILCOR) states these side effects of CPR\(^3\):

“Rib fractures and other injuries are common but acceptable consequences of CPR given the alternative of death from cardiac arrest. After resuscitation, all patients should be reassessed and reevaluated for resuscitation-related injuries.”

Apart from the above, skin abrasions, bruising and soreness of the chest are common during the use of the LUCAS Chest Compression System.

2.5 Main parts

The main parts of the LUCAS Chest Compression System include:

- A Back Plate which is positioned underneath the patient as a support for the external chest compressions.
- An Upper Part which contains the proprietary and rechargeable LUCAS Battery and the compression mechanism with the disposable Suction Cup.
- A Stabilization Strap which helps to secure the position of the device in relation to the patient.
- A Carrying Case.

2.7 User Control Panel

This chapter describes the User Control Panel of the LUCAS device with factory default settings.

Your device may be set up with different settings, based on your protocols. Changing factory default settings will change the behavior of the device.

Factory default settings and setup options are identified in chapter 9 in this document.

ON/OFF:
The LUCAS device will power up/power down when you push this key for 1 second. When the device powers up, you will hear an audible signal sequence and the device automatically does a self-test of the functions and the protective system. When the self-test is complete the audible signal stops and a green LED (Light Emitting Diode) beside the ADJUST key illuminates. This procedure takes approximately 3 seconds.

ADJUST:
This mode is used when you want to adjust the position of the Suction Cup. When you push this key, you can manually move the Suction Cup up or down.

To set the Start Position of the Suction Cup, manually push down the Suction Cup onto the chest of the patient.

To lift up the Suction Cup from the chest, manually pull up the Suction Cup.

Setup options: The device can be set up for manual or automatic movement of the Suction Cup.

PAUSE:
When you push the PAUSE key after adjusting the Suction Cup to the patient’s chest, the height position of the Suction Cup is fine-tuned and locked into the Start Position.

When you push this key during device compressions, the LUCAS device will stop compressions and lock the Suction Cup in its Start Position.

Setup options: The device can be set up for different automatic height adjustments of the Suction Cup.

ACTIVE (continuous):
When you push this key, the LUCAS device performs continuous chest compressions. The green LED signal will blink 10 times per minute to alert for ventilation during ongoing compressions.

Setup options: The device can be set up for different numbers of ventilation alerts, audible alert signal on/off, ventilation pause duration, and automatic adjustment of the Suction Cup. The rate and depth can be configured to different fixed values. The device can be configured to alter between rates by pushing the ACTIVE (continuous or 30:2) key during ongoing compressions.

ACTIVE (30:2):
When you push this key, the LUCAS device performs 30 chest compressions and then temporarily stops. During the stop, the operator can perform 2 ventilations. After the stop the cycle starts again. An intermittent LED in combination with an audible signal sequence will alert the operator before each ventilation pause.

Setup options: The device can be setup for other compression to ventilation ratios, ventilation pause duration, and automatic adjustment of the Suction Cup. The rate and depth can be configured to different fixed values. The device can be configured to alter between rates by pushing the ACTIVE (continuous or 30:2) key during ongoing compressions.
Battery indicator:
The three green LEDs show the Battery charge status:

- Three green LEDs: Fully charged
- Two green LEDs: 2/3 charged
- One green LED: 1/3 charged
- One intermittent yellow LED and alarm during operation: low battery, approximately 10 minutes of operating capacity remaining.
- One intermittent red LED and an alarm signal: the Battery is empty and must be recharged, or the Battery is too hot.

Note: When the LED to the far right is yellow and not green, the Battery has reached the end of its service life. Jolife recommends that you replace this Battery with a new one.

MUTE:
If you push this key when the LUCAS device operates, you mute the alarm for 60 seconds. If you push this key when the LUCAS device is powered off, the Battery indicator shows the Battery charge status of the Battery.

High priority alarms:
One intermittent red LED and an alarm signal sequence indicate malfunction. A high priority alarm will take precedence over lower priority or information alarms.

Refer to Troubleshooting 8: 8.1 for indications and alerts during normal operation. 8.3 for malfunction alarms.

TRANSMIT data:
Push this key to send device data and receive new setup options. The device has to be in Power OFF mode to send and receive data.

For more information, please refer to Physio-Control data management programs, or contact your local Physio-Control or Stryker representative.

Caution - radio frequency
Radio frequency communications can affect other medical electrical equipment.
3 Safety precautions

To ensure maximum safety, always read this section carefully before operating, carrying out any work on the equipment or making any adjustments.

3.1 Signal words

Throughout the manual, signal words are indicated with, "WARNING" or "CAUTION".

- CAUTION - signal word used to indicate a potentially hazardous situation which, if not avoided, could result in minor or moderate injury.
- WARNING - signal word used to indicate a potentially hazardous situation which, if not avoided, could result in death or serious injury.

3.2 Personnel

Jolife recommends that the LUCAS Chest Compression System is only used by persons with medical skills such as: First responders, ambulance personnel, nurses, physicians or medical staff, who have:

- undertaken a CPR course according to the resuscitation guidelines, e.g. American Heart Association, European Council of Resuscitation or equivalent,
- AND received training in how to use the LUCAS device.

3.3 Contraindications

Do NOT use the LUCAS Chest Compression System in these cases:

- If it is not possible to position the LUCAS device safely or correctly on the patient’s chest.
- Too small patient: if the LUCAS device alerts with 3 fast signals when lowering the Suction Cup, and you cannot enter the PAUSE mode or ACTIVE mode.
- Too large patient: If you cannot lock the Upper Part of the LUCAS device to the Back Plate without compressing the patient’s chest.

Always follow local and/or international guidelines for CPR when you use the LUCAS Chest Compression System.

3.4 Side effects

The International Liaison Committee on Resuscitation (ILCOR) states the following side effects of CPR:

“Rib fractures and other injuries are common but acceptable consequences of CPR given the alternative of death from cardiac arrest. After resuscitation, all patients should be reassessed and re-evaluated for resuscitation-related injuries.”

The above side effects, as well as skin abrasions, bruising and soreness of the chest, are common during the use of LUCAS Chest Compression System.

3.6 General safety precautions

Caution - use only approved accessories
Use only Jolife-approved accessories with the LUCAS Chest Compression System. The LUCAS device may not operate correctly if you use accessories that are not approved. Use only LUCAS Batteries and the LUCAS Power Supply that are designed for the LUCAS device. If you use other batteries or power supply you can cause permanent damage to the LUCAS device. This also voids the warranty.

Caution - liquid
Do not immerse the LUCAS Chest Compression System in liquid. The device can be damaged if liquid enters the hood.

WARNING - FIRE
Do not use the LUCAS Chest Compression System in oxygen rich environments or in conjunction with flammable agents or with flammable anaesthetics.

Caution - electrical device
To isolate mains from the LUCAS device, disconnect the mains plug from mains outlet.

Caution - other medical equipment
The LUCAS device can affect other medical electrical equipment with regards to EMC (Electromagnetic Compatibility). Take into account the technical information in section 9.9 Electromagnetic environmental declaration.

Caution – portable RF communications equipment
Portable RF communications equipment (including antennas and cables) should be used no closer than 30 cm (12 inches) to any part of the LUCAS device.

3.7 Battery

WARNING - LOW BATTERY
When the yellow Battery LED shows an intermittent light, do one of these:
- Replace the Battery with one that is charged.
- Connect the external LUCAS Power Supply.

Caution - keep Battery installed
The Battery must always be installed for the LUCAS device to be able to operate, also when powered by the external Power Supply.

To minimize interruptions, we recommend to always have a charged spare LUCAS Battery in the Carrying Case.

3.8 Operation

WARNING - UNSATISFACTORY POSITION
Start manual CPR again if it is not possible to position the LUCAS device safely or correctly on the patient’s chest.

WARNING - INCORRECT POSITION OVER CHEST
If the pressure pad is not in the correct position in relation to the sternum, there is an increased risk of damage to the rib cage and the internal organs. Also, the patient’s blood circulation is compromised.

WARNING - INCORRECT START POSITION
The patient’s blood circulation is compromised if the pressure pad presses down too heavily or too lightly on the chest. Push the ADJUST key and adjust the height of the Suction Cup immediately.

WARNING - CHANGED POSITION DURING OPERATION
If the position of the Suction Cup changes during operation or during defibrillation, immediately push ADJUST and adjust the position. Always use the LUCAS Stabilization Strap to help secure the correct position.

Caution - defibrillation electrodes
Position the defibrillator electrodes and wires so that they are not under the Suction Cup. If there are already electrodes on the patient, make sure that they are not under the Suction Cup. If they are, you must apply new electrodes.

Caution - gel on chest
If there is gel on the patient’s chest (e.g. from ultrasound examination), the position of the Suction Cup can change during use. Remove all gel before you apply the Suction Cup.
Caution - Stabilization Strap application
Delay the application of the LUCAS Stabilization Strap if this prevents or delays any medical treatment of the patient.

Caution - adjunctive therapies
The use of other medical equipment or drugs in conjunction with the LUCAS device can affect the treatment. Always consult the Instructions for Use for the other equipment and/or drugs to make sure that they are appropriate for use in conjunction with CPR.

WARNING - ECG interference
Chest compressions interfere with ECG analysis. Push PAUSE before you start the ECG analysis. Make the interruption as short as possible. Push ACTIVE (continuous) or ACTIVE (30:2) to start the compressions again.

WARNING - ELECTRICAL SHOCK
If the external Power Supply cord (optional accessory) is damaged, remove and replace it immediately to avoid the risk of electrical shock or fire.

WARNING - PATIENT INJURY
Do not let the patient or the device stay unattended when the LUCAS device operates.

Caution - keep your fingers away
Do not put your hands on or below the Suction Cup when the LUCAS device operates. Keep your fingers away from the claw locks when attaching the Upper Part or lifting the patient.

Caution - IV access
Make sure that IV access is not obstructed.

Caution - do not block the vent holes
Do not cause a blockage of the vent holes under the hood since this can cause the device to become too hot.

Caution - device alarms
If there is any malfunction during operation the red Alarm LED will illuminate and a high priority alarm will be heard.

For troubleshooting, see section 8.3.

WARNING - MALFUNCTION
If there are interruptions, or the compressions are not sufficient, or something unusual occurs during operation:
Push ON/OFF for 1 second to stop mechanical chest compressions and remove the device. Immediately start manual chest compressions.

Caution - do not lift by the straps
Do not use the straps for lifting. The straps are only to fixate the patient to the LUCAS device.

Caution - skin burns
The temperatures of the hood and battery may rise above 118 °F / 48 °C. If hot, avoid prolonged contact to prevent skin burns. Remove patient hands from patient straps.

3.9 Service
We recommend a yearly servicing of the LUCAS device to make sure that it operates correctly. Use the original shipping box when you send the device for servicing. Keep the original shipping box with padding for this purpose.

WARNING - DO NOT OPEN
Never open the casing of the LUCAS device. Do not change or modify external or internal parts of the LUCAS Chest Compression System.

Unless specified differently, all servicing and repairs must be done by service personnel that are approved by Physio-Control, Stryker or Jolife.

If the above conditions are not followed, this can lead to patient/operator injury or death, and will void the warranty.

Consult your local distributor, Physio-Control, Stryker or Jolife for current information on where to send the LUCAS device for maintenance.
4 First use preparations

4.1 Delivered items

LUCAS Chest Compression System is supplied in one box with:

- A LUCAS device (Upper Part and Back Plate)
- 2 disposable LUCAS Suction Cups
- A LUCAS Carrying Case
- Instructions for Use in the relevant language version
- A rechargeable LUCAS Battery
- A LUCAS Stabilization Strap
- LUCAS Patient Straps

Accessories (optional):
- Disposable LUCAS Suction Cups
- External LUCAS Battery Charger
- Spare LUCAS Batteries
- LUCAS Power Supply with Mains cord
- LUCAS 12-28VDC Car Power Cable

*For more accessories, please see Appendix A: LUCAS 3, Version 3.1 parts and accessories.*

4.2 The Battery

The proprietary Lithium Polymer (LiPo) Battery is the exclusive power source for the LUCAS Chest Compression System. You can remove the Battery from the LUCAS device and recharge it. The Battery is mechanically keyed into the LUCAS device and in the Battery Charger to make sure you get the correct installation. The top of the Battery has connections for power and communications to the Battery Charger and to the LUCAS device.

4.2.1 Charge the Battery

You can charge the LUCAS Battery in two ways:

- In the LUCAS Battery Charger:
  - put the Battery in the slot of the Battery Charger,
  - connect the Battery Charger power cord to the mains wall outlet.
- Installed in the LUCAS device:
  - put the Battery in the slot of the hood of the LUCAS device,
  - connect the Power Supply to the DC input on the side of the LUCAS device,
  - connect the Power Supply to the mains wall outlet.

During charge, 3 green LEDs will show a “running” light.

**Caution - keep Battery installed**
The Battery must always be installed for the LUCAS device to be able to operate, also when powered by the external Power Supply.

**Caution - use only approved accessories**
Use only Jolife-approved accessories with the LUCAS Chest Compression System. The LUCAS device may not operate correctly if you use accessories that are not approved. Use only LUCAS Batteries and the LUCAS Power Supply that are designed for the LUCAS device. If you use other batteries or Power Supply you can cause permanent damage to the LUCAS device. This also voids the warranty.
4.3 Prepare the Stabilization Strap

Before the first use of the LUCAS Chest Compression System, attach the support leg straps, which are part of the Stabilization Strap, to the LUCAS support legs.

1. Fold one support leg strap around each LUCAS support leg.
2. Fasten the buckles on the inner side of the support leg.

4.4 Prepare the Carrying Case

1. Insert a fully charged LUCAS Battery in the Battery slot in the hood of the LUCAS device.
2. Make sure that a Suction Cup is mounted correctly.
3. Make sure that the patient straps and the support leg straps are attached to the Upper Part.
4. Put the Upper Part in the Carrying Case with the DC input placed downward.

   **Note:** Putting the LUCAS device in this position makes it possible to charge the device through the Carrying Case charger port access and to check Battery charge status through the Carrying Case top window.

5. In the Carrying Case compartment between the LUCAS support legs, you may put optional accessories such as the external Power Supply, a charged spare LUCAS Battery and extra Suction Cups.
6. Make sure the neck strap of the Stabilization Strap is placed on top in the Carrying Case compartment and is easy to find.
7. Slide the Back Plate into the Carrying Case cover lid compartment.
8. Put the Instructions for Use in the transparent pocket.
9. Close the Carrying Case.

4.5 Optional: Change device factory default settings

The LUCAS factory default settings are consistent with 2015 American Heart Association (AHA) and European Resuscitation Council (ERC) guidelines. Setup options should be changed only under the direction of a physician knowledgeable in cardiopulmonary resuscitation who is familiar with the literature in this area.

If you want to change the factory default settings, please refer to Physio-Control data management programs, or contact your local Physio-Control or Stryker representative.

Factory default settings and setup options are identified in chapter 9 in this document.
5 Use the LUCAS device

5.1 Arrival at the patient

When you have confirmed a cardiac arrest, immediately start manual cardiopulmonary resuscitation (CPR). Minimize interruptions to manual chest compressions during the preparation and application of the LUCAS Chest Compression System.

5.2 Unpack the device

1. Open the Carrying Case.

2. Push ON/OFF on the User Control Panel for 1 second to power up the LUCAS device and start the self test. The green LED adjacent to the ADJUST key illuminates when the device is ready for use.

Note: If you let the LUCAS device stay in ADJUST mode, it will power off automatically after 5 minutes.

Caution - device alarms
If there is any malfunction during operation the red Alarm LED will illuminate and a high priority alarm will be heard. For troubleshooting, refer to section 8.3.

Caution - keep Battery installed
The Battery must always be installed for the LUCAS device to be able to operate, also when powered by the external Power Supply.
5.3 Apply to patient

Keep interruptions to CPR to a minimum when applying the LUCAS device to the patient.

It is possible to deploy the device with interruptions to CPR of less than 20 seconds.

5.3.1 Place the Back Plate

1. Remove the LUCAS Back Plate from the Carrying Case.

2. Minimize interruption to manual CPR by planning for and coordinating the placement of the back plate.
   - Make sure to support the patient’s head.
   - Pause manual CPR briefly while putting the LUCAS Back Plate under the patient, immediately below the arm pits. Use one of these procedures:
     a. Hold the patient’s shoulder and lift the patient’s upper body a small distance,
     b. Roll the patient from side to side.

3. Resume manual CPR immediately.

Note: An accurate position of the Back Plate makes it easier and faster to position the Suction Cup correctly.
5.3.2 Attach the Upper Part

1. Hold the handles on the support legs to remove the LUCAS Upper Part from the Carrying Case.
2. Pull the release rings once to make sure that the claw locks are open.
3. Let go of the release rings.

4. Minimize interruptions to manual CPR by planning and coordinating the attachment and correct positioning of the Upper Part:
   a. During ongoing manual chest compressions, attach the support leg that is nearest to you to the back plate.
   b. Stop manual CPR while attaching the other support leg to the Back Plate, so that the two support legs lock against the Back Plate.
   c. Listen for click. Pull up once to make sure that the parts are correctly attached.

Note: If the LUCAS Upper Part does not attach to the Back Plate, make sure that the claw locks are open and that you have released the release rings.

WARNING - TOO LARGE PATIENT
If the patient is too large, the Upper Part of the LUCAS device cannot lock to the Back Plate without compressing the patient’s chest. Immediately resume manual compressions.
5.4 Adjustment and operation

The compression point should be at the same spot as for manual CPR and according to guidelines.

When the pressure pad in the Suction Cup is in the correct position, the lower edge of the Suction Cup is immediately above the end of the sternum.

**WARNING - INCORRECT POSITION OVER CHEST**

If the pressure pad is not in the correct position in relation to the sternum, there is an increased risk of damage to the rib cage and the internal organs. Also, the patient's blood circulation may be compromised.

1. Use your finger to make sure that the lower edge of the Suction Cup is immediately above the end of the sternum.

   ![Image of Suction Cup outer edge]

   If necessary, move the device by pulling the support legs to adjust the position.

2. Adjust the height of the Suction Cup to set the Start Position.
   a. Make sure that the LUCAS device is in the ADJUST mode.
   b. Push the Suction Cup down until the pressure pad touches the patient's chest without compressing the chest.
LUCAS® 3 Chest Compression System – INSTRUCTIONS FOR USE

WARNING - TOO SMALL PATIENT
If the LUCAS device alerts with 3 fast signals when lowering the Suction Cup, and you cannot enter the PAUSE mode or ACTIVE mode. Immediately start manual compressions again.

WARNING - INCORRECT START POSITION
The patient’s blood circulation may be compromised if the pressure pad presses down too heavily or too lightly on the chest. Push the ADJUST key and adjust the height of the Suction Cup immediately.

Caution - gel on chest
If there is gel on the patient’s chest (e.g. from ultrasound examination), the position of the Suction Cup can change during operation. Remove all gel before you apply the Suction Cup.

Caution - keep your fingers away
Do not put your hands or other body parts on or below the Suction Cup when the LUCAS device operates. Do not touch the claw locks, especially when you lift the patient.

WARNING - PATIENT INJURY
Do not let the patient or the device stay unattended when the LUCAS device operates.

WARNING - CHANGED POSITION DURING OPERATION
If the position of the Suction Cup changes during operation or during defibrillation, immediately push ADJUST and adjust the position. Always use the LUCAS Stabilization Strap to help secure the correct position.

Note: Your device may be set up with different settings, based on your protocols. These settings include number of ventilation alerts, audible alert signal on/off, compression to ventilation ratio, ventilation pause duration, and automatic adjustment of the Suction Cup. The rate and depth can be configured to different fixed values. The device can be configured to alter between rates by pushing the ACTIVE (continuous or 30:2) key during ongoing compressions.

Factory default settings and setup options are identified in chapter 9 in this document.

Note: If you let the LUCAS device stay in PAUSE mode, it will power off automatically after 30 minutes.

WARNING - UNSATISFACTORY POSITION
Immediately start manual CPR again if it is not possible to position the LUCAS device safely or correctly on the patient’s chest.
WARNING - MALFUNCTION
If there are interruptions, or the compressions are not sufficient, or something unusual occurs during operation:

Push ON/OFF for 1 second to stop mechanical chest compressions and remove the device. Immediately start manual chest compressions.

WARNING - LOW BATTERY
When the yellow Battery LED shows an intermittent light, do one of these:

- Replace the Battery with one that is charged.
- Connect the external LUCAS Power Supply.

Caution - do not block the vent holes
Do not cause a blockage of the vent holes under the hood since this can cause the device to become too hot.

5.5 Apply the Stabilization Strap
The LUCAS Stabilization Strap helps secure the correct position during operation. Apply it while the LUCAS device is active to keep interruptions to a minimum.

Caution - Stabilization Strap application
Delay the application of the LUCAS Stabilization Strap if this prevents or delays any medical treatment of the patient.

1. Remove the neck strap, which is a part of the Stabilization Strap, from the Carrying Case (the support legs strap of the Stabilization Strap should already be attached to the support legs).

2. Extend the neck strap fully at the buckles.

3. Carefully lift the patient’s head and put the cushion behind the patient’s neck. Position the cushion as near the patient’s shoulders as possible.

4. Connect the buckles on the support leg straps with the buckles on the neck strap. Make sure that the straps are not twisted.

5. Hold the LUCAS support legs stable and tighten the neck strap tightly.

6. Make sure that the position of the Suction Cup is correct on the patient’s chest.

   If it is not, adjust the position:
   a. Push ADJUST.
   b. Release the neck strap from the support leg straps.
   c. Adjust the Suction Cup position (as described in the section 5.4.2).
   d. When the Suction Cup is in the correct position, push ACTIVE (continuous) or ACTIVE (30:2) to start the compressions again.
   e. Attach the neck strap again. Refer to the steps 2 to 5 above.
5.6 Move the patient

5.6.1 Secure the patient’s arms

When you move the patient, you can secure the patient’s arms with the Patient Straps on the LUCAS device. This makes it easier to move the patient.

Caution - do not lift by the straps
Do not use the straps for lifting. The straps are only to fixate the patient to the LUCAS device.

Caution - IV access
Make sure that IV access is not obstructed.

Caution - skin burns
The temperatures of the hood and battery may rise above 118 °F / 48 °C. If hot, avoid prolonged contact to prevent skin burns. Remove patient hands from patient straps.

5.6.2 Prepare to lift the patient

1. Make a decision about what equipment you will move and where to put the transportation device.

2. Those at the patient’s side:
   a. put one hand below the claw locks under the support leg
   b. with the other hand, hold the patient’s belt, trousers or under the thigh

3. Make sure that the patient’s head is stable.
5.6.3 Lift and move the patient

The LUCAS Chest Compression System can deliver compressions while you lift or move the patient if:

- The LUCAS device and the patient are safely positioned on the transportation device
- The LUCAS device stays in the correct position and angle on the patient’s chest

If necessary, adjust the position of the Suction Cup.

**WARNING - CHANGED POSITION DURING OPERATION**

If the position of the Suction Cup changes during operation or during defibrillation, immediately push **ADJUST** and adjust the position. Always use the LUCAS Stabilization Strap to help secure the correct position.

5.7 Replace the Power Supply during operation

When the Battery charge is low, the LUCAS device alarms with an intermittent yellow LED and an alarm signal.

5.7.1 Change the Battery

Keep interruptions to a minimum while changing the Battery.

**Note:** To minimize interruptions, we recommend to always have a charged spare LUCAS Battery in the Carrying Case.

1. Push **PAUSE** to temporarily stop the compressions.
2. Pull the Battery out and then upwards to remove it.
3. Install a fully-charged LUCAS Battery. Put it in from above.
4. Wait until the green PAUSE mode LED illuminates.
5. Push **ACTIVE (continuous)** or **ACTIVE (30:2)** to start the chest compressions again. The LUCAS device remembers the settings and Start Position for 60 seconds.

**Note:** If you change the Battery in less than 60 seconds, the device remembers the Suction Cup Start Position. This allows you to quickly resume compressions by pushing **ACTIVE** (continuous or 30:2) key. If it takes more than 60 seconds, the device performs a self test and you must set the Start Position again.
5.7.2 Connect to the external Power Supply

You can connect the LUCAS Power Supply or Car Power Cable in all operation modes of the LUCAS device.

**Caution - keep Battery installed**
The Battery must always be installed for the LUCAS device to be able to operate, also when powered by the external Power Supply.

To use the Power Supply cable:
- Connect the Power Supply cable to the LUCAS device.
- Connect the mains cable to the wall mains outlet (100-240V, 50/60Hz)

To use the Car Power Cable:
- Connect the Car Power Cable to the LUCAS device
- Connect the Car Power Cable to the car outlet (12-28VDC)

5.8 Adjunctive therapies

**Caution - adjunctive therapies**
The use of other medical equipment or drugs in conjunction with the LUCAS device can affect the treatment. Always consult the instructions for use for the other equipment and/or drugs to make sure that they are applicable in conjunction with CPR.

5.8.1 Defibrillation

Defibrillation can be performed while the LUCAS device operates.
- You can apply the defibrillation electrodes before or after the LUCAS device has been put in position.
- Perform the defibrillation according to the instructions from the manufacturer of the defibrillator.

**Caution - defibrillation electrodes**
Position the defibrillation electrodes and wires so that they are not under the Suction Cup. If there are already electrodes on the patient, make sure that they are not under the Suction Cup. If they are, you must apply new electrodes.
- After defibrillation, make sure that the position of the Suction Cup is correct. If necessary, adjust the position.

**WARNING - CHANGED POSITION DURING OPERATION**
If the position of the Suction Cup changes during operation or during defibrillation, immediately push ADJUST and adjust the position. Always use the LUCAS Stabilization Strap to help secure the correct position.

**WARNING - ECG INTERFERENCE**
Chest compressions interfere with ECG analysis. Push PAUSE before you start the ECG analysis. Make the interruption as short as possible. Push ACTIVE (continuous) or ACTIVE (30:2) to start the compressions again.
5.8.2 Ventilation

Always follow local and/or international guidelines for ventilation.

The LUCAS Chest Compression System can operate in two different modes:

- **ACTIVE (continuous)**
  When you push this key, the LUCAS device performs continuous compressions. The green LED signal will blink 10 times per minute to alert for ventilation during ongoing compressions.

- **ACTIVE (30:2)**
  When you push this key, the LUCAS device performs 30 chest compressions and then temporarily stops for the operator to provide two ventilations. After the stop the cycle starts again. An intermittent LED in combination with an audible signal sequence alerts the operator before each ventilation pause.

**Note:** Your device may be set up with different settings, based on your protocols. These settings include number of ventilation alerts, audible alert signal on/off, compression to ventilation ratio, ventilation pause duration, and automatic adjustment of the Suction Cup. The rate and depth can be configured to different fixed values. The device can be configured to alter between rates by pushing the ACTIVE (continuous or 30:2) key during ongoing compressions.

Factory default settings and setup options are identified in chapter 9 in this document.

5.8.3 Use in the catheterization laboratory

The LUCAS Chest Compression System can be used in the catheterization laboratory. Except for the compression mechanism it is mainly radiotranslucent and allows for most X-ray projections.

5.9 Remove the device from the patient

1. Push ON/OFF for 1 second to power off the device.
2. If a LUCAS Stabilization Strap is attached to the LUCAS device, remove the neck strap, which is part of the Stabilization Strap, from the support leg straps.
3. Pull the release rings to remove the Upper Part from the Back Plate.
4. If the patient’s condition allows it, remove the Back Plate.
6 Care after use and preparation for next use

6.1 Optional: Send and receive data after the event

The LUCAS Chest Compression System captures data of the device status and use, and can be configured to meet local protocols. The data can be transmitted using Bluetooth or Wifi.

Push the TRANSMIT data key to send device data and receive new configurations.

To transmit:
1. Make sure the LUCAS device is powered OFF
2. Push the TRANSMIT data key

Caution - radio frequency
Radio frequency communications can affect other medical electrical equipment.

For more information, please refer to Physio-Control data management programs, or contact your local Physio-Control or Stryker representative.

6.2 Preparation for next use

Do the following after each use of the LUCAS Chest Compression System:
1. Remove the Suction Cup (refer to section 6.4).
2. If necessary, remove and clean the Patient Straps and the Stabilization Strap separately (refer to section 6.3 and 6.5).
3. Clean the device and let it dry (refer to section 6.3).
4. Replace the used Battery with a fully charged Battery in the battery slot in the hood.
5. Mount a new Suction Cup.
6. Attach the Patient Straps again, if they are removed.
7. Attach the support leg straps of the LUCAS Stabilization Strap again, if they are removed.
8. Pack the device into the Carrying Case:
   • Put the Upper Part in the Carrying Case with the DC input placed downward.
   
   Note: Putting the LUCAS device in this position makes it possible to charge the device through the Carrying Case charger access port and to check Battery charge status through the Carrying Case top window.
   • Put the external Power Supply (optional) in the compartment between the LUCAS support legs.
   • Put a spare (optional) charged LUCAS Battery in the compartment between the LUCAS support legs.
   • Extra Suction Cups can be put in the compartment between the support legs.
   • Put the neck strap of the Stabilization Strap between the support legs.
   • Slide the Back Plate into the Carrying Case cover lid compartment.
   • Put the Instructions for Use in the transparent pocket.
9. Close the Carrying Case.

Do routine checks weekly and after each use (refer to the maintenance section, chapter 7).
6.3 Cleaning routines

Clean all surfaces and straps with a soft cloth and warm water with a mild cleaning agent or disinfectant agent, e.g.

- 70% isopropyl alcohol solution
- 45% isopropyl alcohol with added detergent
- Quaternary ammonium compound
- 10% bleach
- Peracetic (peroxide) acid solutions

Follow the handling instructions from the manufacturer of the disinfectant.

Caution - liquid
Do not immerse the LUCAS Chest Compression System in liquid. The device can be damaged if liquid enters the hood.

Allow the device to dry before you pack it into the Carrying Case.

6.5 Remove and attach the Patient Straps

Remove:
1. Open the Patient Straps and pull them out from the metal rings on the LUCAS support legs.
   
   Clean according to 6.3.

Install:
2. Thread the Patient Straps through the metal holder on the LUCAS support legs.
3. Fold the Patient Strap so that the symbol is visible.
4. Press the strap parts firmly together.

6.4 Remove and install the Suction Cup

- Pull the Suction Cup off the black mounting tube.
- Discard the Suction Cup as contaminated medical waste.
- Bend a new Suction Cup onto the black mounting tube.
- Make sure the Suction Cup is safely attached on the mounting tube.
6.6 Remove and attach the Stabilization Strap

Remove the Support leg straps, which is a part of the Stabilization Strap, by opening the buckles.

*Clean the Stabilization Strap according to 6.3.*

*Install according to 4.3.*

6.7 Remove and recharge the Battery

1. Replace the Battery with a fully charged one.
2. Recharge the used Battery for future use.

You can charge the LUCAS Battery in two ways:

- **In the external LUCAS Battery Charger**
  - put the Battery in the slot of the Battery Charger,
  - connect the Battery Charger power cord to the mains wall outlet.

- **Installed in the LUCAS device:**
  - put the Battery in the slot of the hood of the LUCAS device,
  - connect the Power Supply/Car Power Cable to the DC input on the side of the LUCAS device. This is possible also when the LUCAS device is inside the Carrying Case through the charger port access,
  - connect the Power Supply to the mains wall outlet.

During charge, 3 green LEDs will show a “running” light.

**Caution - keep Battery installed**

The Battery must always be installed for the LUCAS device to be able to operate, also when powered by the external Power Supply.

**Caution - use only approved accessories**

Use only Jolife-approved accessories with the LUCAS Chest Compression System. The LUCAS device may not operate correctly if you use accessories that are not approved. Use only LUCAS Batteries and the LUCAS Power Supply that are designed for the LUCAS device. If you use other batteries or Power Supply you can cause permanent damage to the LUCAS device. This also voids the warranty.
7 Maintenance

7.1 Routine checks

Weekly, and after each use of the LUCAS Chest Compression System, do the following:

Optional: Push TRANSMIT data key to send and receive device data. The device has to be in Power OFF mode.

**Caution - radio frequency**
Radio frequency communications can affect other medical electrical equipment.

1. Make sure that the device is clean.
2. Make sure that a new Suction Cup is installed.
3. Make sure that the Patient Straps are attached.
4. Make sure that the two support leg straps of the Stabilization Strap are attached around the support legs, and that the neck strap is placed in the Carrying Case.
5. Pull the release rings upwards to make sure that the claw locks are open.
6. Make sure that the Battery is fully charged. When the LUCAS device is in the OFF mode, push MUTE. The Battery indicator illuminates and shows the Battery charge status (see section 8.1).
7. Push ON/OFF to make the device do a self test. Make sure the ADJUST LED illuminates with no alarm or warning LED.
8. Push ON/OFF to power off the device again.
9. Make sure that the external Power Supply cord (optional accessory) is not damaged.

**WARNING - ELECTRICAL SHOCK**
If the external Power Supply cord (optional accessory) is damaged, remove and replace it immediately to avoid the risk of electrical shock or fire.
## 8 Troubleshooting

### 8.1 Indications and alerts during normal operation

Refer to the table below to find the reason for sound and/or LED alarms during normal operation.

<table>
<thead>
<tr>
<th>Situation</th>
<th>Visual LED indication</th>
<th>Audible signals</th>
<th>User action</th>
</tr>
</thead>
<tbody>
<tr>
<td>The LUCAS device is in the ON mode and there is more than 90% Battery capacity remaining.</td>
<td><img src="image" alt="Fully charged Battery: All 3 green Battery indication LEDs show a constant light." /></td>
<td>None</td>
<td>None</td>
</tr>
<tr>
<td>The LUCAS device is in the ON mode and there is more than 60% and less than 90% Battery capacity remaining.</td>
<td><img src="image" alt="2/3 charged Battery: The 2 green Battery indication LEDs to the right show a constant light." /></td>
<td>None</td>
<td>None</td>
</tr>
<tr>
<td>The LUCAS device is in the ON mode and there is more than 30% and less than 60% Battery capacity remaining.</td>
<td><img src="image" alt="1/3 charged Battery: The green Battery indication LED farthest to the right shows a constant light." /></td>
<td>None</td>
<td>None</td>
</tr>
<tr>
<td>The LUCAS device is in the ON mode and there is less than 30% Battery capacity remaining (approximately 10 minutes of operating capacity).</td>
<td><img src="image" alt="Low Battery: The yellow Battery indication LED farthest to the right illuminates intermittently." /></td>
<td>Medium priority alarm ■ ■ ■ (5s) ■ ■ ■ (5s)...</td>
<td>Replace the Battery or connect to the external power supply.</td>

<tr>
<td>Power OFF</td>
<td>None</td>
<td>A “ding-dong” sound</td>
<td>None</td>
</tr>
</tbody>
</table>
### Situation | Visual LED indication | Audible signals | User action
--- | --- | --- | ---
In the ACTIVE (continuous) mode | The ACTIVE (continuous) key, the LUCAS device performs continuous chest compressions. The green LED signal will blink 10 times per minute. Optional setup: 6 to 10 times per minute | None | This is to alert for ventilation during ongoing compressions.

In the ACTIVE (30:2) mode | The ACTIVE (30:2) LED shows a green light with an intermittent LED during the five final compressions before each ventilation pause. | Audible signal during compressions | This is to alert the operator to ventilate the patient when the device temporarily stops the compressions for ventilation.

When the Suction Cup is in a lower position than for the minimum patient (sternum height below 6.7 inches / 17 cm) and you cannot enter the PAUSE mode or ACTIVE mode, the patient is too small. | None | 3 fast signals ■ ■ ■ (0.25s) | Immediately start manual compressions

Too large gap between the pressure pad and the patient’s chest during operation. The patient will get too shallow compressions. | None | 3 fast signals during operation ■ ■ ■ (0.6s) | Push ADJUST and readjust the Start Position to eliminate the gap. Restart the compressions.

### 8.2 Battery replacement

If you change the Battery in less than 60 seconds, the device remembers the Suction Cup Start Position. This allows you to quickly resume compressions by pushing ACTIVE (continuous or 30:2). If it takes more than 60 seconds, the device performs a self test and you must set the Start Position again.

<table>

8.3 Malfunction alarms

Below is a list of all alarms that can occur on the LUCAS device. You mute all alarms for 60 seconds if you push MUTE. To reset the below alarms the device has to be powered off by pressing the ON/OFF key for 1 second.

A high priority alarm will take precedence over lower priority or information alarms.

Start with manual compressions immediately if the LUCAS device does not operate properly.

<table>
<thead>
<tr>

</tbody>
</table>
| Compression mode ACTIVE 30:2 | Factory default setting  
30:2 (30 compressions followed by a 3-second ventilation pause)  
**Setup options:**  
The device can be setup to provide a compression/ventilation ratio of any of the following ratios: 30:2 and 50:2  
The device can be setup to provide a ventilation pause duration of a value between 3 to 5 seconds.  
The device can be setup to enable the operator to change compression rate during operation. The rate is changed by pushing ACTIVE key (continuous or 30:2) during ongoing compressions. |
| Suction Cup Start Position | Factory default setting  
QuickFit: The operator manually lowers the Suction Cup to the chest. When pushing the PAUSE key, coming from ADJUST mode, the LUCAS device fine-tunes the Suction Cup height position to the chest within a distance of 1.2 inches / 30 mm, and then the LUCAS device locks the Start Position.  
**Setup options:**  
The device can be setup for QuickFit, AutoFit or Manual.  
AutoFit: The device automatically lowers the Suction Cup from its upper position down to the chest and finds and locks the Start Position. The device will do the AutoFit when the operator pushes PAUSE key coming from ADJUST mode.  
Manual: The operator manually lowers the Suction Cup to the chest. When pushing the PAUSE key, the LUCAS device locks the Start Position. No fine-tuning will occur. |
| Suction Cup in ADJUST mode | Factory default setting  
Manual: The Suction Cup has to be pulled up manually  
**Setup options:**  
The device can be setup so that the Suction Cup automatically returns up from the chest when the operator pushes the ADJUST key coming from PAUSE or ACTIVE modes. |
| Pressure pad in PAUSE mode | Factory default setting  
The device stops compressions and locks the pressure pad in its Start Position.  
**Setup options:**  
To allow for chest rise during ventilation, the device can be setup so that the pressure pad moves up 0.4 inch / 10 mm above the Start Position during PAUSE. |
| Pressure pad during ventilation pauses in ACTIVE modes | Factory default setting  
The device temporarily stops compressions and locks the pressure pad in its Start Position.  
**Setup options:**  
To allow for chest rise during ventilation, the device can be setup so that the pressure pad moves up 0.4 inch / 10 mm above the Start Position during ventilation pauses. |
### Pressure pad in ACTIVE modes

**Specifications**
- Factory default setting
- The pressure pad returns to Start Position between each compression

**Setup options**
- To allow for chest rise during asynchronous ventilation, the device can be setup so that the pressure pad moves up 0.4 inch / 10 mm above the Start Position at every compression.

### Audible timers

**Specifications**
- Factory default setting
- No timer (OFF)

**Setup options**
- The device can be setup to provide a recurring audible alert at a specified time interval of any value between 1 to 15 minutes. The audible alert is a short signal sequence. The timer can be setup as either CPR Timer or Continuous Timer:
  - **CPR Timer**: The device only measures the time in uninterrupted ACTIVE (30:2 or continuous) modes. The CPR Timer stops and resets when the operator pushes PAUSE or ADJUST keys. The CPR Timer starts from zero again the next time the operator pushes the ACTIVE (30:2 or continuous) key. For example if CPR Timer is set for 2 minutes, the device will alert after every 2 minutes of compressions.
  - **Continuous Timer**: The device measures the time continuously, independent of what mode the device is in. The Continuous Timer starts when the operator pushes the ACTIVE (30:2 or continuous) key the first time and will alert at the defined time interval until the device is powered off. For example if Continuous Timer is set for 2 minutes, the device will alert every 2 minutes until power off.

</tr>
</tbody>
</table>

NOTE: The ALARM SYSTEM also generates an independent audible ALARM SIGNAL with above stated sequence of tones by a mechanical buzzer (2400 +/- 100 Hz).

LATCHING ALARM SIGNAL = ALARM SIGNAL that continues to be generated after its triggering event no longer exists, until stopped by deliberate OPERATOR action.
NON-LATCHING ALARM SIGNAL = ALARM SIGNAL that automatically stops being generated when its associated triggering event no longer exists.

\[ t_d = \text{PULSE duration (electrical ON time)} \]
\[ t_s = \text{PULSE spacing (electrical OFF time)} \]
\[ t_b = \text{INTERBURST INTERVAL (electrical OFF time)} \]
\[ f_s = \text{fundamental frequency (first harmonic) of a PULSE} \]

System delays = Sum of alarm signal generation delay and alarm condition delay mean (time from the occurrence of a triggering event to the generation of its alarm signal).

</tr>
</tbody>
</table>

where $P$ is the maximum output power rating of the transmitter in watts (W) according to the transmitter manufacturer and $d$ is the recommended separation distance in meters (m).

Field strengths from fixed RF transmitters, as determined by an electromagnetic site survey, must be less than the compliance level in each frequency range. Interference can occur near equipment marked with the following symbol.

NOTE 1 At 80 MHz and 800 MHz, the higher frequency range applies.

NOTE 2 These guidelines may not apply in some situations. Electromagnetic propagation is affected by absorption and reflected from structures, objects and people.

* Field strengths from fixed transmitters, such as base stations for radio (cellular/cordless) telephones and land mobile radios, amateur radio, AM and FM radio broadcast and TV broadcast cannot be predicted theoretically with accuracy. To assess the electromagnetic environment due to fixed RF transmitters, an electromagnetic site survey should be considered. If the measured field strength in the location in which the LUCAS device is used exceeds the applicable RF compliance level above, the LUCAS device should be observed to make sure it operates normally. If unusual or incorrect performance is observed, additional measures can be necessary, such as reorienting or relocating the LUCAS device.

b Over the frequency range 150 kHz to 80 MHz, field strengths should be less than 10 V/m.

Recommended separation distances between portable and mobile RF communications equipment and the LUCAS device

The LUCAS device is intended for use in an electromagnetic environment in which radiated RF disturbances are controlled. The customer or the operator of the LUCAS device can help prevent electromagnetic interference by maintaining a minimum distance between portable and mobile RF communications equipment (transmitters) and the LUCAS device as recommended below, according to the maximum output power of the communications equipment.
Rated maximum output power of transmitter W

<table>
<thead>
<tr>
<th>Frequency Range</th>

<td>( d = 2.3 \sqrt[3]{P} )</td>
</tr>
</tbody>
</table>

0.01, 0.1, 1, 10, 100

For transmitters rated at a maximum output power not listed above, the recommended separation distance \( d \) in meters (m) can be estimated using the equation applicable to the frequency of the transmitter, where \( P \) is the maximum output power rating of the transmitter in watts (W) according to the transmitter manufacturer.

Note 1: At 80 MHz and 800 MHz, the separation distance for the higher frequency range applies.

Note 2: These guidelines may not apply in all situations. Electromagnetic propagation is affected by absorption and reflection from structures, objects and people.

9.10 Limited warranty

Subject to the limitations and exclusions set forth below, Jolife AB ("Jolife") warrants that Jolife products which are purchased from authorized Jolife representatives or dealers and are used in accordance with their instructions will be free from defects in material and workmanship appearing under normal service and use for the time period listed below. The time limit and the warranty schedule begin on the date of delivery to the first purchaser.

12 Months: LUCAS 3 Chest Compression System (including the LUCAS device (Upper Part and Back Plate), Carrying Case, Battery, Stabilization Strap, Patient Straps).

Jolife does not warrant that Jolife products will perform error-free or without interruptions. The sole and exclusive remedy under this limited warranty is to repair or replace defective material or workmanship at the option of Jolife. To qualify for the repair or replacement, the product must not have been repaired or altered in any way which, in the judgment of Jolife, affects its stability and reliability. The product must have been used and maintained in accordance with applicable operating instructions and in the intended environment or setting.

The Limited Warranty does not cover problems with products that have been caused by misuse, abuse, improper maintenance, modifications to the product or accident. Jolife or its authorized service provider shall, in its sole discretion, determine whether a reported problem is covered under this Limited Warranty and whether the product is field serviceable. If field serviceable and located within 100 miles of a Jolife designated service location, warranty service will be provided by Jolife or its authorized service provider at the purchaser’s facility during normal business hours. If not field serviceable or if the product is located outside of such areas, all products requiring warranty service should be returned to a location designated by Jolife or its authorized service provider, freight prepaid, and must be accompanied by a written, detailed explanation of the claimed failure.

Except for the Limited Warranty provided above, NEITHER JOLIFE NOR ITS AUTHORIZED SERVICE PROVIDER MAKES ANY WARRANTY, EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, ANY IMPLIED WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, WHETHER ARISING FROM STATUTE, COMMON LAW, CUSTOMER OR OTHERWISE. THIS LIMITED WARRANTY SHALL BE THE EXCLUSIVE REMEDY AVAILABLE TO ANY PERSON OR ENTITY. NEITHER JOLIFE NOR ITS AUTHORIZED SERVICE PROVIDER IS LIABLE FOR DIRECT OR INDIRECT, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES (INCLUDING LOSS OF BUSINESS OR PROFITS) WHETHER BASED ON CONTRACT, TORT, OR ANY OTHER SUPPORT LEGAL THEORY.

Any support legal action arising from the purchase or use of Jolife products shall be commenced within one year from the accrual of the cause of action, or be barred forever. In no event shall Jolife liability under this warranty or otherwise exceed the greater of $50,000 or the purchase price of the product giving rise to the cause of action.

Products are warranted in conformance with applicable laws. If any part or term of this Limited Warranty is held to be illegal, unenforceable or in conflict with applicable law by any court of competent jurisdiction, the validity of the remaining portions of the Limited Warranty shall not be affected, and all rights and obligations shall be construed and enforced as if this Limited Warranty did not contain the particular part or term held to be invalid. Some countries, and states within United States of America, do not allow the exclusion or limitation of incidental or consequential damages, so the above limitation or exclusion may not apply to you. This Limited Warranty gives the user specific support legal rights. The user may also have other rights which vary from state to state or country to country.

Appendix B: Maintenance - Routine checks

Make copies of this check list to track the routine maintenance of your LUCAS device. Weekly, and after each use of the LUCAS Chest Compression System, do the following:

Date and signature

1. Make sure that the device is clean.

2. Make sure that a new Suction Cup is installed.

3. Make sure that the Patient Straps are attached.

4. Make sure that the two support leg straps of the Stabilization Strap are attached around the support legs, and that the neck strap is placed in the Carrying Case.

5. Pull the release rings upwards to make sure that the claw locks are open.

6. Make sure that the Battery is fully charged. When the LUCAS device is in the OFF mode, push MUTE. The Battery indicator illuminates and shows the Battery charge status (see section 8.1).

7. Push ON/OFF to make the device do a self test. Make sure the ADJUST LED illuminates with no alarm or warning LED.

8. Push ON/OFF to power down the device again.

9. Make sure that the external Power Supply cord (optional accessory) is not damaged.

WARNING - ELECTRICAL SHOCK
If the external Power Supply cord (optional accessory) is damaged, remove and replace it immediately to avoid the risk of electrical shock or fire.

10. Optional: push TRANSMIT key to send and receive device data. The device has to be in Power OFF mode.

Caution - radio frequency
Radio frequency communications can affect other medical electrical equipment.

LUCAS® 3 CHEST COMPRESSION SYSTEM

QUICK REFERENCE GUIDE

LUCAS is intended for use as an adjunct to manual CPR when effective manual CPR is not possible (e.g., during patient transport or extended CPR when fatigue may prohibit the delivery of effective/consistent compressions to the victim, or when insufficient EMS personnel are available to provide effective CPR). Refer to the Instructions For Use for complete directions for use, indications, contraindications, warnings, precautions and potential adverse events.

1. POWER ON LUCAS.

- Push ON/OFF to start self-test and power up the LUCAS device
- The device will be ready and in the ADJUST mode

2. PLACE THE LUCAS BACK PLATE.

- Pause manual CPR briefly
- Put the BACK PLATE under the patient, immediately below the armpits

3. ATTACH THE UPPER PART.

- Pull the RELEASE RINGS once to open CLAW LOCKS. Then let go of the rings
- Stop manual CPR briefly while attaching the UPPER PART to the BACK PLATE. Listen for "CLICK" sound
- Pull up once to ensure attachment

4. PUSH DOWN SUCTION CUP. ADJUST POSITION IF NEEDED.

- Push down the SUCTION CUP
- The lower edge of SUCTION CUP should be immediately above the end of the sternum
- Adjust if necessary (stay in ADJUST mode)

5. LOCK POSITION. START COMPRESSIONS.

- Push PAUSE to lock START POSITION
- Push ACTIVE (continuous) or ACTIVE (30:2) to start compressions
